

25/08:

White Box Testing :- Transparent.

↳ App oda source code a test pannathu.

Black Box Testing :-

↳ Test functionalities of the result.

Git Commands :-

- git clone " "
- git clone " " new folder → in the file kula load aagum
- explorer
- start filename } To open non-text files.
- history
- ls
- git clone " "
- git add newfolder
- git checkout main

* Staging area in local is common to all branches.

• Untracked → Working Dir

↳ Ella branch baigum varum.

• Staging ←

• Odu branch la commit pannita matra branch la kaanikaathu.

↳ But commit panna branch la kaanikum.

→ git merge master.

↓

Current branch la illatha files a eduthuta varum.

- _/_/_
- git rebase master.
 - ↳ Commit-based.
 - git rm rebasefile.
 - ↳ To remove files.
 - git stash.
 - ↳ Temporarily save.
 - git stash pop.
 - ↳ To use the file again.
 - ↳ Shows it again in staging area.

Instance - Shadow.

Virtualization → Hardware a virtualize panni, athuku
on OS potu user parathu.

- ↳ Hypervisor → Helps to virtualize (partition)
 - ↳ Type - 2 (Virtual Box, VMWare)

Containerization → Virtualizes the OS.

↳ Benefit :- Don't need additional OS.

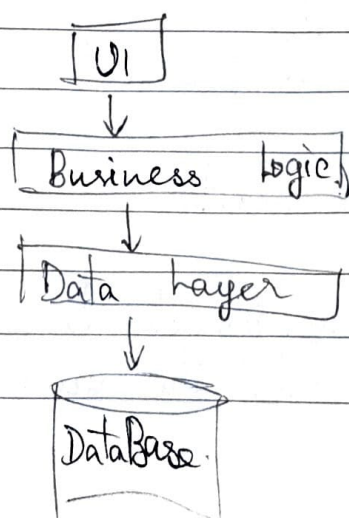

!! Install Ubuntu Server OS.

↳ Create VM.

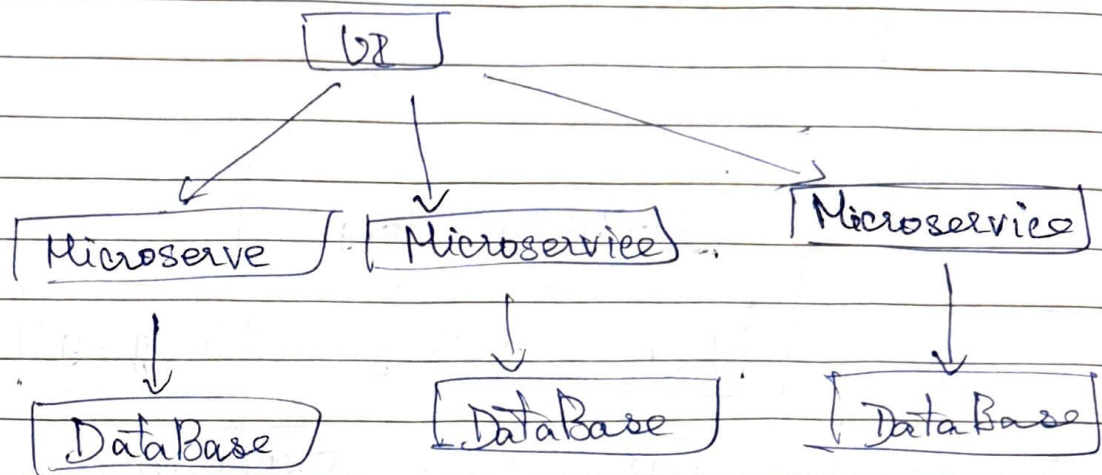

↳ VM Name :- Ubuntu Server.

OS :- Ubuntu Server OS

Monolithic Architecture:

Microservice Architecture:

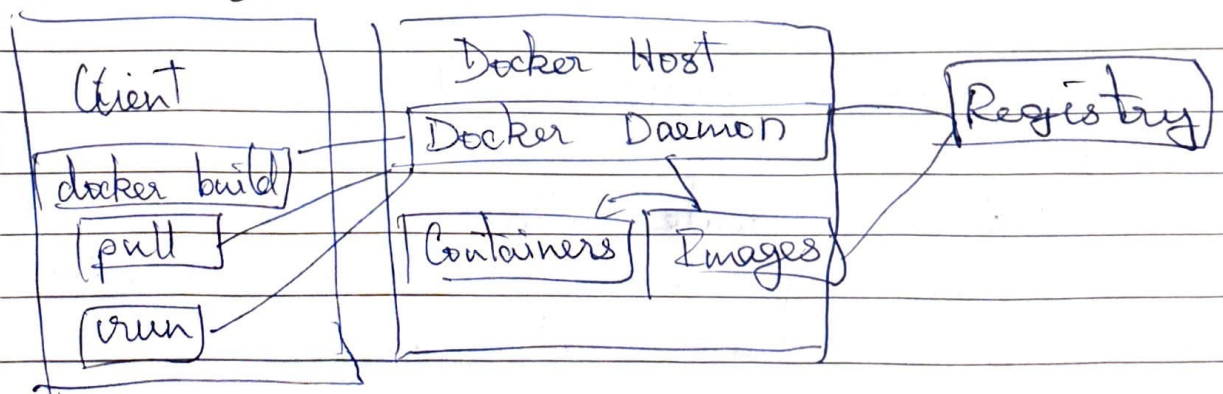

Microservices :

- The idea behind microservices is that some types of applications become easier to build and maintain when they are broken into smaller, composable pieces which work together.
- Each component is developed separately

Docker:

- Docker Registry is a storage component for docker images.
- Docker Hub is Docker's very own cloud repo.
- Images can be private/public.

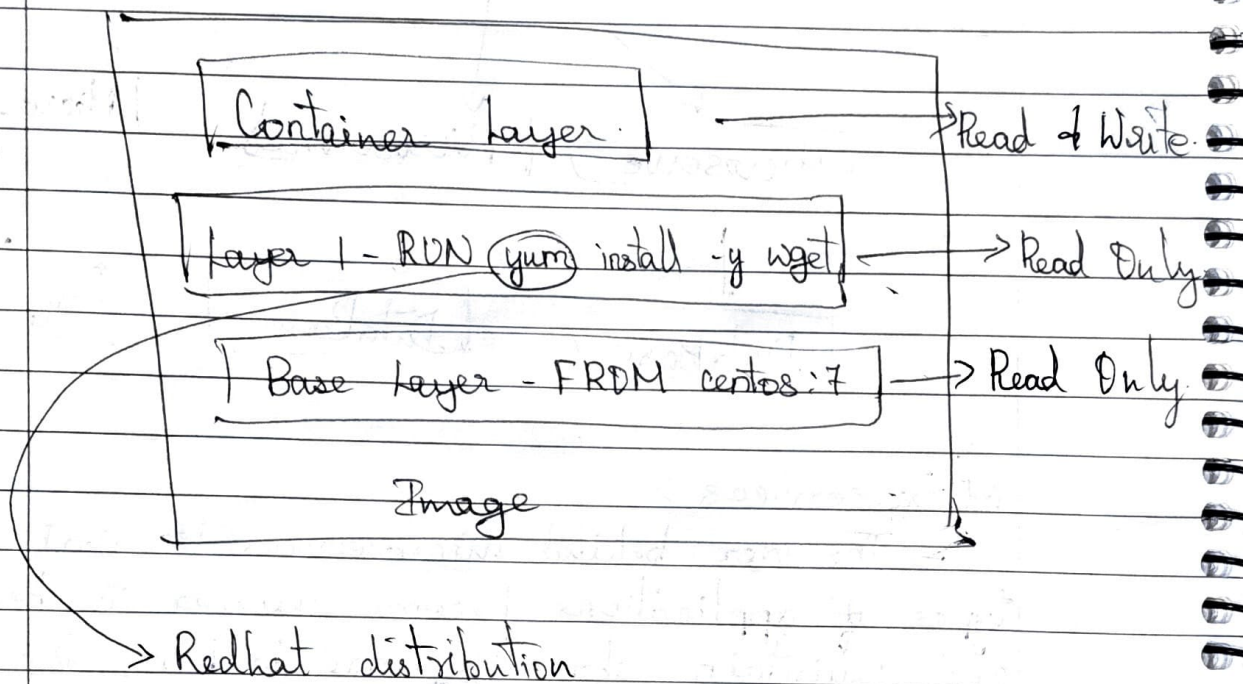

Containerization:-

//_

* Docker Engine produces containers.

Docker Images.

Docker Commands :-

→ docker -v

→ docker search node → image name

→ docker pull node

→ docker images

* All images have unique IDs.

→ docker run node → image name.

* Apache in docker is httpd

→ docker create httpd

→ docker ps -a → To view all containers.

→ docker start containername
